

Amendment to the Abstract:

The Abstract has been amended as indicated below. A revised Abstract is attached.

A shrink disc unit ~~comprising:~~including a rotating body with a peripheral outer surface~~[[,]]~~ and a hub~~[[,]]~~ surrounding the rotating body with a peripheral inner surface, ~~which together with,~~ The peripheral inner surface and the peripheral outer surface form a separating line between the rotating body and the hub at an angle to a rotational axis of the rotating body, ~~in the longitudinal section of the shrink disc unit, whereby the hub may be shrunk onto the rotating body along the separating line, or is shrunk over the separating line;~~ a fluid channel, ~~leading~~ leads through the rotating body or the hub~~[[,]]~~ for ~~pressurisation~~ pressurization of the separating line with a pressure fluid; ~~and a,~~ A fixing device, formed from one of the rotating body or the hub, alone or in combination with the other, may be used to fix ~~and by means of which a tool for the assembly or disassembly of the hub may be either supported on the rotating body or the hub and which may be fixed at a given angular position on the rotating body and/or the hub.~~
